Why MassTransit?

An easy-to-use, consistent way to move files - MassTransit is designed to be extremely easy to use, requiring both internal users, as well as remote users, to simply drag and drop folder hierarchies into a hot folder, to successfully send or receive files (including Macintosh files and folders).

MassTransit provides flexible file transfer workflow options - From fully automated server-to-server workflows, to Web Client-to-server options, desktop driven transfers, the product provides a range of easy-to-use options for exchanging high-value digital assets.

Secures proprietary and confidential file transfers. On-the-fly encryption of files being transferred using TripleDES, RC4-128 or RC4-40 ensures that the confidential data will not be compromised during transfers.

MassTransit's powerful protocol eliminates issues - such as those caused by long file names - and ensures fast, reliable delivery of even the largest (as large as 75GB), most complex files and folders. In-line lossless compression/decompression speeds transfers without taking user time and the Macintosh savvy protocol seamlessly protects all the special elements of Mac files. MassTransit offers virtually unlimited connectivity options including TCP/IP, Secure TCP, a built-in, fully configurable FTP server and an automated FTP client for both Mac and Windows.

In a nutshell:
- Clients do not have to compress files, can send native format.
- Security.
- Faster upload times.
- More reliability.
- Free service to client.
- Logging and email.
